TransUnion Demo Site — Content Specification

Format reference: aiformorningstar.com (screenshots in reference section)
Footer text: **Prepared for TransUnion by the Glean team**
Greeting name: **Good afternoon, Jonathan** (Jonathan Soto — AI Enterprise Service Owner)

This is a **fictitious, hard-coded demo** meant to *feel* like a real Glean + TransUnion experience, anchored on their **OneTru AI Assist** initiative and executive AI goals.

Global Config

- **Domain / Title:** `aitransunion.com` — "OneTru AI Assist × Glean"
- **Primary audience:**
  - Bharat Kandanoor (VP Engineering | Architecture | AI | Security)
  - Jonathan Soto (AI Enterprise Service Owner)
  - Enterprise Strategy & Transformation (e.g., Gary Aiello, Barbara Obregon-Achilles)
  - Security leadership (e.g., Laura Delaney)
  - Solutions Enablement / Commercial University (e.g., Elizabeth Isphording, Corinne Davis)
- **Core narrative:**
  - TransUnion is standing up **OneTru AI Assist** on top of **Google's agentic AI / Gemini stack** and a homegrown data platform.
  - They must **onboard 45+ enterprise systems** (Workday, Coupa, Jira, Confluence, Remedy, Salesforce, Peoplesoft/finance tools, etc.) while keeping **security and governance** tight.
  - Glean acts as the **horizontal work AI fabric**: connectors + search + agents, embedded into TU's own UI and OneTru AI experience.

Welcome Modal

- **Tagline (top subheader):** `Prepared for TransUnion by the Glean team`

- **Logos:** `Glean × TransUnion` (use TU wordmark + teal/blue accent from their brand)

- **Heading:**
  See what Glean could look like for OneTru AI Assist

- **Bullets:**
    - 🚀 **Accelerate OneTru AI Assist** — unify 45+ enterprise systems (Workday, Coupa, Jira, Confluence, Remedy, Salesforce, Outlook, SharePoint and more) behind a single, secure AI layer.
    - 🔍 **Trusted answers across TU's knowledge** — Glean grounds every response in your architecture docs, tickets, policies, and runbooks, with citations and deep links back to the source.
    - 🔒 **Built for regulated data** — enterprise-grade security, permission-aware by default, aligned with TransUnion's risk and compliance posture.

- **CTA:** `Show me how it works →`

- **Sub-CTA (small text):** `This is a personalized demo — no login required`

Landing / Persona Picker

- **Heading:**
  `See what Glean could look like for TransUnion`

- **Subheading:**
  `Choose a perspective to explore`

- **Persona cards (4):**

1. **AI Platform & Enterprise IT**
   Subtitle: `OneTru AI Assist leadership (Bharat & Jonathan)`

2. **IT Ops & Service Reliability**
   Subtitle: `IT Ops / Service Desk lead`

3. **Security, Risk & Compliance**
   Subtitle: `Security Strategy, Planning & Transformation`

4. **Solutions Consulting & Enablement**
   Subtitle: `TransUnion Commercial University / SC CoE`

Clicking each card opens the chat view with the appropriate **flow** preloaded.

Shared Assistant Experience

- **Greeting (hero):** `Good afternoon, Jonathan`
- **Input box placeholder:**
  `Ask about your AI platform, incidents, security posture, or go-to-market enablement…`
- **Tabs:** `Chat | Search`
- **Footer tagline:** `Prepared for TransUnion by the Glean team`

Each flow defines:

- Sidebar (TODAY + RECENT)
- Pre-loaded query
- “Show work” steps
- Answer (Markdown)
- Source cards

Flow 1: AI Platform & Enterprise IT (OneTru AI Assist)

Target Persona:
AI Enterprise Service Owner / VP Engineering (Jonathan Soto / Bharat Kandanoor)

TODAY

- OneTru AI Assist — Data Onboarding Plan

RECENT

- 45+ Source Inventory — Enterprise Apps
- Gemini Pilot — Lessons Learned
- Build vs Buy — Connector Analysis
- OneTru AI Assist Risk Register
- Executive AI Readout — CIO Prep
- TU Data Platform Reference Architecture

(Implement using the same CSV-style data table as Morningstar in Cursor.)

Pre-loaded Query

Give me a concrete plan for onboarding Workday, Coupa, Jira, Confluence, Remedy, Salesforce, and Outlook content into OneTru AI Assist using Glean as the connector and search layer. Summarize:

- **What Glean provides out-of-the-box vs. what we'd still have to build;**
- **How permissions and data residency would be handled;**
- **A realistic 60–90 day rollout sequence.**

"Show Work" (hard-coded)

- `Security Review — External AI Vendors`

Synthesizing answer

- `OneTru AI Assist × Glean — Data Onboarding Plan` (Confluence icon)

Italic summary line:
Cross-referencing 5 primary sources across Confluence, SharePoint, and Glean docs to propose a phased connector rollout aligned to OneTru AI Assist.

Output (Markdown)

Here's a proposed 60–90 day onboarding plan for Workday, Coupa, Jira, Confluence, Remedy, Salesforce, and Outlook using Glean.

1. **What Glean provides out-of-the-box**

- **Native connectors** for Workday, Coupa, Jira, Confluence, Salesforce, and Microsoft 365 (Outlook/SharePoint/Teams) with **delta sync, full-text indexing, and permission mirroring**.
- Support for **TU's existing SSO** and group-based entitlements, so OneTru AI Assist only surfaces content users can already see in each source.
- Search and chat interface that can be **embedded into the OneTru AI Assist UI** or accessed via Glean's own web app.

2. **Where you'd still build custom pieces**

    - **Remedy / ITSM & asset tools:** Glean can index via API, but you'll likely want a **thin TU-owned adapter** that normalizes ticket and CMDB schemas into your enterprise data platform.
    - **Data platform abstractions:** to keep OneTru AI Assist vendor-agnostic, you'll continue to expose a **unified data access layer**; Glean's connectors plug into that where possible rather than duplicating pipelines.
    - **Custom agents:** e.g., "Incident Triage Assistant" or "Connector Health Monitor" built on top of Glean's APIs but branded and orchestrated from your existing AI gateway.

3. **Security and data residency**

    - Glean honors **row- and field-level permissions** from each source system; its index never exposes content to users who don't already have access.
    - Data remains in **regional data centers** aligned with TU policy, with all content encrypted in transit and at rest. For high-sensitivity systems (e.g., certain finance or credit bureaus), you can limit Glean to **metadata-only** or specific fields.
    - All AI actions are **fully auditable**: you can log prompts, source docs, and outputs into your existing security monitoring stack.

4. **60–90 day rollout sequence**

    1. **Weeks 1–2 — Foundation**
        - Stand up Glean in a **non-production tenant** tied to TU SSO.
        - Connect **Confluence, Jira, and SharePoint** for a small IT / AI platform pilot group.
    2. **Weeks 3–4 — Enterprise systems**

    - Add **Workday, Coupa, and Salesforce**; validate permission behavior with HR, Procurement, and RevOps.
    - Run **side-by-side comparisons** with your Gemini pilot to validate answer quality and coverage.
3. **Weeks 5–8 — IT Ops & email**
    - Bring in **Remedy / ITSM data** via the adapter approach and **Outlook** for email context.
    - Launch a limited **OneTru AI Assist + Glean pilot** for IT Ops and Security, focusing on incident triage and policy questions.
4. **Weeks 9–12 — Scale and harden**
    - Expand to additional critical systems on your 45-source list.
    - Finalize **runbooks, SLAs, and risk controls** for a production-grade rollout under the OneTru AI Assist banner.

If you'd like, I can turn this into a **CIO-level one-pager** or a **detailed workback plan** for your architecture review.

TODAY

- P1 Incident — Payment API Latency (US Region)

RECENT

- Incident Runbook — Latency / Timeouts
- Change Calendar — November Releases
- Remedy Queue — Open Sev 1–2 Tickets
- Asset CMDB — US Region Services
- Known Issues — OneTru AI Assist Integrations
- Post-Incident Review — October Outage

Pre-loaded Query

A P1 incident has been raised for high latency on our US payment APIs. Pull a unified view that summarizes:

- **Current impact and affected services;**
- **Related change tickets or recent deployments;**
- **Recommended triage and escalation steps for the on-call team.**

“Show Work”

Searching company knowledge

`Q P1 payment api latency US region remedy incident jira change deployment known issues`

- `Remedy Ticket – INC-45821 (Payment API Latency – US)` (Remedy icon)
- `Jira Change – CHG-2379 Payment Gateway v4.3 rollout` (Jira icon)
- `Known Issues – OneTru AI Assist & Payment Services` (Confluence icon)
- `API Latency Runbook – Payments` (Confluence icon)
- `US Region Service Map` (SharePoint icon)

Reading documents

- `Remedy Ticket – INC-45821`
- `API Latency Runbook – Payments`
- `Jira Change – CHG-2379`
- `US Region Service Map`

Synthesizing answer

- `P1 Incident Summary – Payment API Latency` (Confluence icon)

Italic summary:
Cross-referencing 4 primary sources across Remedy, Jira, Confluence, and SharePoint to generate a unified P1 incident view for the on-call team.

Output (Markdown)

Here's a unified P1 view for the US payment API latency incident.

1. **Current impact**

    - Remedy ticket **INC-45821** reports **p95 latency > 3 seconds** and sporadic timeouts for the `/authorize` and `/capture` endpoints in the **US region**.
    - Monitoring data in the linked dashboard shows impact starting at **10:42 CT**, primarily affecting **card and loan origination flows** for select partners.
    - No hard errors yet, but SLO burn rate indicates potential **SLA breach within 45–60 minutes** if unresolved.

2. **Related changes / potential causes**

    - Linked change ticket **CHG-2379** deployed **Payment Gateway v4.3** to US at **09:55 CT**, including:
        - New fraud-scoring callout to an external service.
        - Configuration updates to retry logic on downstream credit services.
    - **Known Issues** doc flags a prior pattern where **misconfigured timeouts on the external fraud service** caused similar latency spikes under load.

3. **Recommended triage steps (from runbook)**

    1. **Validate scope**
        - Confirm whether EU/APAC regions are unaffected.
        - Check if **non-payment APIs** on the same cluster show similar symptoms.
    2. **Quick mitigations**
        - If error rate remains low but latency is high, **temporarily disable the new fraud callout** via feature flag (see "v4.3 rollout" section of the runbook).
        - If timeouts start to spike, follow **"rollback to v4.2"** procedure in CHG-2379.
    3. **Communication**

        - Notify **On-Call Incident Commander** and update the **#it-incidents** channel with the current status and mitigation path.
        - If rollback is initiated, trigger the **standard customer comms template** for degraded performance (linked in the runbook).

2. **Escalation path**

    - If latency remains elevated **15 minutes after disabling the fraud callout**, escalate to:
        - **Payments SRE** lead on call.
        - **Fraud Services owner** (for external dependency review).
        - **OneTru AI Assist team** only if the issue appears to be query-routing or agent related.

I can also **draft the incident timeline and PIR outline** once the incident is resolved.

- `Data Classification & Handling Policy v3.2`
- `Vendor Security Review — Glean`
- `Security Exceptions — Q4 2025`

Synthesizing answer

- `GenAI & OneTru AI Assist — Control Overview` (Confluence icon)

Italic summary:
Cross-referencing 4 primary sources across SharePoint, Confluence, and GRC/Jira to summarize AI controls and open risks.

Output (Markdown)

Here's a briefing on current AI-related controls and gaps.

1. **Generative AI & OneTru AI Assist access**

    - OneTru AI Assist is **limited to employees in Enterprise, HR, and IT Ops** for the current pilot, with access gated via SSO and group membership.
    - Prompts and responses are **logged for audit**, but logs are stored separately from application data with a 90-day retention policy.
    - External LLM providers (e.g., Gemini) are configured to **exclude training on TU data** and are accessed only via approved gateways.

2. **Data classification & scope**

    - Current pilot explicitly **excludes PCI and consumer credit file content**, focusing instead on:
        - Enterprise tools (Jira, Confluence, Workday, Coupa, Remedy, Salesforce).
        - Internal policies, architecture docs, and runbooks.
    - HR data in Workday is accessible only at an **aggregated or redacted level** per the classification policy.

3. **Third-party AI vendors (Glean example)**

    - Security review for Glean notes:
        - SOC 2-type controls, encryption in transit and at rest, SSO integration.
        - **Permission mirroring** for each source system, reducing risk of oversharing.
        - Option for **regional data hosting** aligned with TU's data residency requirements.
    - Open questions include:
        - Finalizing **data residency mapping** for EU and India content.
        - Confirming how **access logs** from Glean will be fed into TU's SIEM.

4. **Open high-severity gaps (last quarter)**

    - Incomplete **data classification tags** on several legacy repositories that OneTru AI Assist may ingest in future phases.
    - Lack of a **formal AI usage standard** for business teams (shadow pilots and ad-hoc tools).
    - Need for **centralized incident handling** for AI-related data exposure events.

5. **Recommended actions for the next Steering Committee**

    1. Approve a **phased expansion** of OneTru AI Assist + Glean into additional systems **only once classification tags reach >95% coverage** on targeted repositories.
    2. Endorse a **TU-wide AI Acceptable Use Policy**, with explicit guidance on internal vs. external tools and approved patterns for customer-facing use.
    3. Require all approved AI vendors (including Glean) to **stream access logs into the central SIEM** and define **standard detection rules** for anomalous access.

I can also convert this into a **2-slide summary** for the Steering Committee deck.

Synthesizing answer

- `90-Day Ramp Plan – Banking Solutions Consultant` (Confluence icon)

Italic summary:
Cross-referencing 4 primary sources across LMS, SharePoint, Gong, and Confluence to generate a 30–60–90 ramp plan.

Output (Markdown)

Here's a 30–60–90 day ramp plan for a new banking solutions consultant.

1. **Days 0–30 — Foundations**

    - **Commercial University**
        - Complete **core SC curriculum**: TU value story, data products, industry overview.
        - Pass required assessments on **data privacy, compliance, and "Information for Good" positioning.**
    - **Product & AI**
        - Self-guided modules on **credit, fraud, and identity solutions**, plus an intro to **OneTru AI Assist** and how SCs are expected to use it in discovery and demos.
    - **Call listening (Gong)**
        - Listen to **3 curated banking AI calls**, focusing on:
            - How SCs frame TU's data advantage.
            - How they explain OneTru AI Assist and AI governance.
        - Capture 3–5 talk tracks and objections in a personal playbook.

2. **Days 31–60 — Applied practice**

    - **Shadowing & roleplays**
        - Shadow 4–6 live customer calls with a senior SC in banking / lending.

        - Run **two internal dry-runs** of a OneTru AI Assist-enabled demo using this same interactive site pattern.
    - **Content & proposals**
        - Review **standard RFP responses and proposal templates** for banking.
        - Use Glean to build a **customer-specific "call brief"** for two target accounts, pulling in prior calls, proposals, and competitive intel.

3. **Days 61–90 — Ownership**

    - **Own portions of live calls**
        - Lead discovery for 3–5 banking accounts under a senior SC's supervision, using OneTru AI Assist to prepare and follow up.
    - **Personalized assets**
        - Build a **reusable demo script** and **OneTru AI Assist agent configuration** tailored to a priority segment (e.g., regional banks vs. fintech lenders).
    - **Certification**
        - Complete an internal "Banking SC Certification," including:
            - Delivering a full end-to-end demo.
            - Handling security and AI governance questions confidently.

I can also turn this into a **checklist view** for your LMS or a **manager-facing tracker**.

Implementation Notes for Cursor

Reuse the Morningstar implementation notes with small wording tweaks:

- **Citation numbers:** same blue circle superscripts mapped to source cards.
- **Source card icons:** adjust set to highlight TU-relevant systems:
  - Salesforce, Jira, Confluence, Remedy/ITSM, Workday, Coupa, SharePoint, Outlook/Exchange, Gong, LMS/Cornerstone.
- **"Show work" section:** 3 stages (`Searching → Reading → Synthesizing`) with document pills and app icons.
- **Sidebar:** same TODAY / RECENT headers, truncated titles with ellipses.
- **Tooltip on source cards:**
  In a live environment, these open directly in Confluence, Jira, Remedy, Workday — wherever the doc lives.
